

# Strengthening Local Capacity through Geo-Enabling Technologies

---

October 26, 2023

---

# Speakers

**Soukeyna Kane**, Director of the Fragility, Conflict and Violence Group, World Bank

**Mokshana Wijeyeratne**, Sr. Environmental Specialist, Environment and Natural Resources Global Practice, World Bank

**Shraddhanand Shukla**, Associate Researcher Climate Hazards Center, UCSB

**Carrie Stokes**, Chief Geographer and GeoCenter Director USAID

**Bahar Salimova**, Sr. Operations Officer/Program Manager at the Fragility, Conflict and Violence Group, World Bank

**Dr. Abdou Ali**, Senior Hydromet Specialist, Head of the Information and Research Department AGRHYMET Regional Center

**Kyle Alden**, GIS Specialist, REFS, Analysis and Learning Division USAID

# GEMS

Introduction to  
Geo-Enabling initiative for  
Monitoring & Supervision

# Geo-Enabling initiative for Monitoring & Supervision

---

Bahar Salimova, Sr. Operations Officer/Program Manager, World Bank

---

# Geo-Enabling initiative for Monitoring & Supervision

Building Capacity among Clients and Local Stakeholders

Offered by the World Bank's Fragility, Conflict and Violence (FCV) Group

Supported by the Korea Trust Fund for Economic and Peacebuilding Transitions and the WBG Partnership Fund for the Sustainable Development Goals

For more information and additional resources, see the GEMS website at: [www.worldbank.org/gems](http://www.worldbank.org/gems)

Smartphones

[See here for a summary video on the work with ESA](#)

# The GEMS Method

**GEMS systematically builds client capacity in the creation of customized digital data collection and monitoring systems, to contribute to effective planning, real-time M&E and remote supervision of operations, and close data gaps along the project cycle.**

Focuses on local capacity-building and client ownership of stronger M&E practices and customized use of digital technology

Utilizes cost-free open-source tools and hand-held devices (smartphones/tablets)

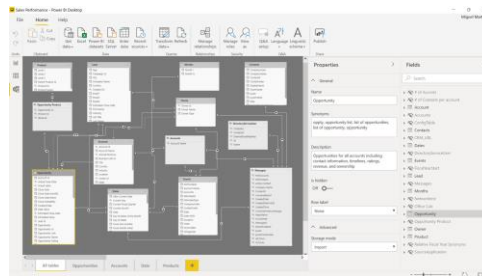

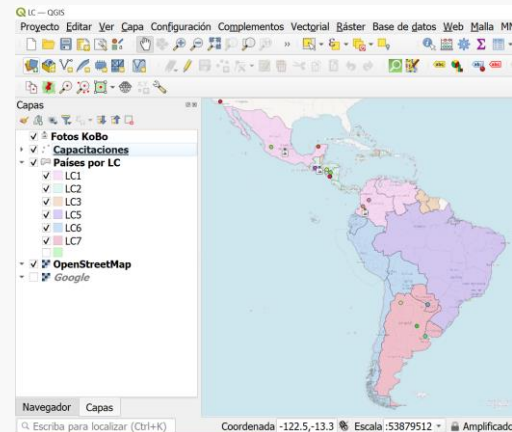

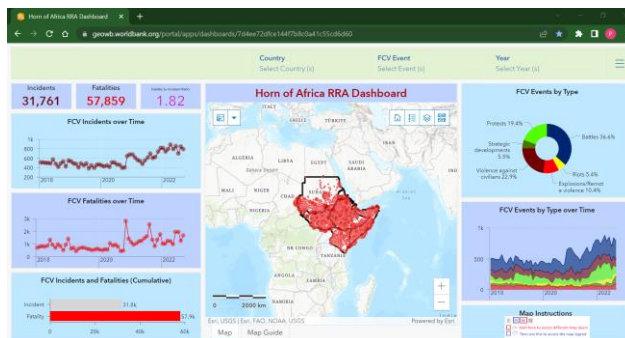

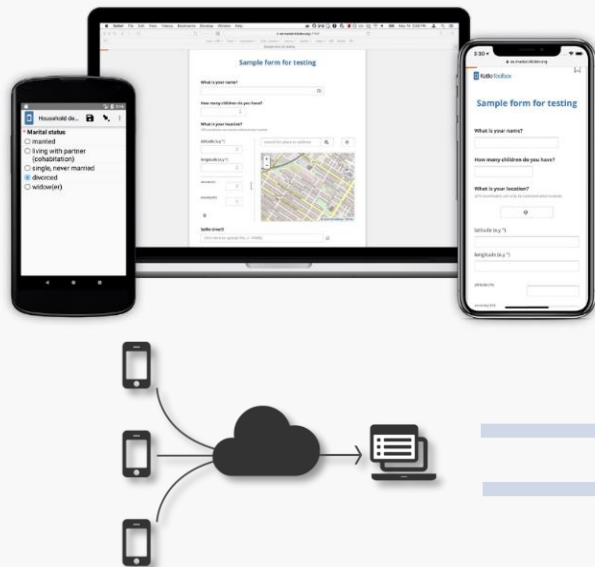

Enables systematic collection of granular, geo-tagged data to create interactive dashboards and maps

Contributes to projects' supervision and M&E goals and provides inputs to a variety of customized data and analytical products

# GEMS' Guiding Principle: Technological inter-operability for data collection and analysis

## Project Planning and Preparation

Kosovo, Niger, Tuvalu, etc.

## Portfolio Targeting and Programming

Madagascar, DRC, Iraq, Somalia, etc.

## Portfolio Mapping & Coordination

20 countries in AFR and growing

## Remote SPN in Conflict Contexts

Afghanistan, Mali, Cameroon, etc.

## Real-time Tracking of Service Delivery

CAR, DRC, Haiti, Bangladesh, etc.

## Project Progress Monitoring

Dozens of projects around the world

## Real-Time Risk/ESF Management

Myanmar, Maldives, Brazil, etc.

## Mapping of GBV Service Providers

Nigeria, Sahel, Pakistan, Mozambique

## Citizen Engagement and GRM

Azerbaijan, Burundi, Philippines

## Stakeholder Engagement and Surveys

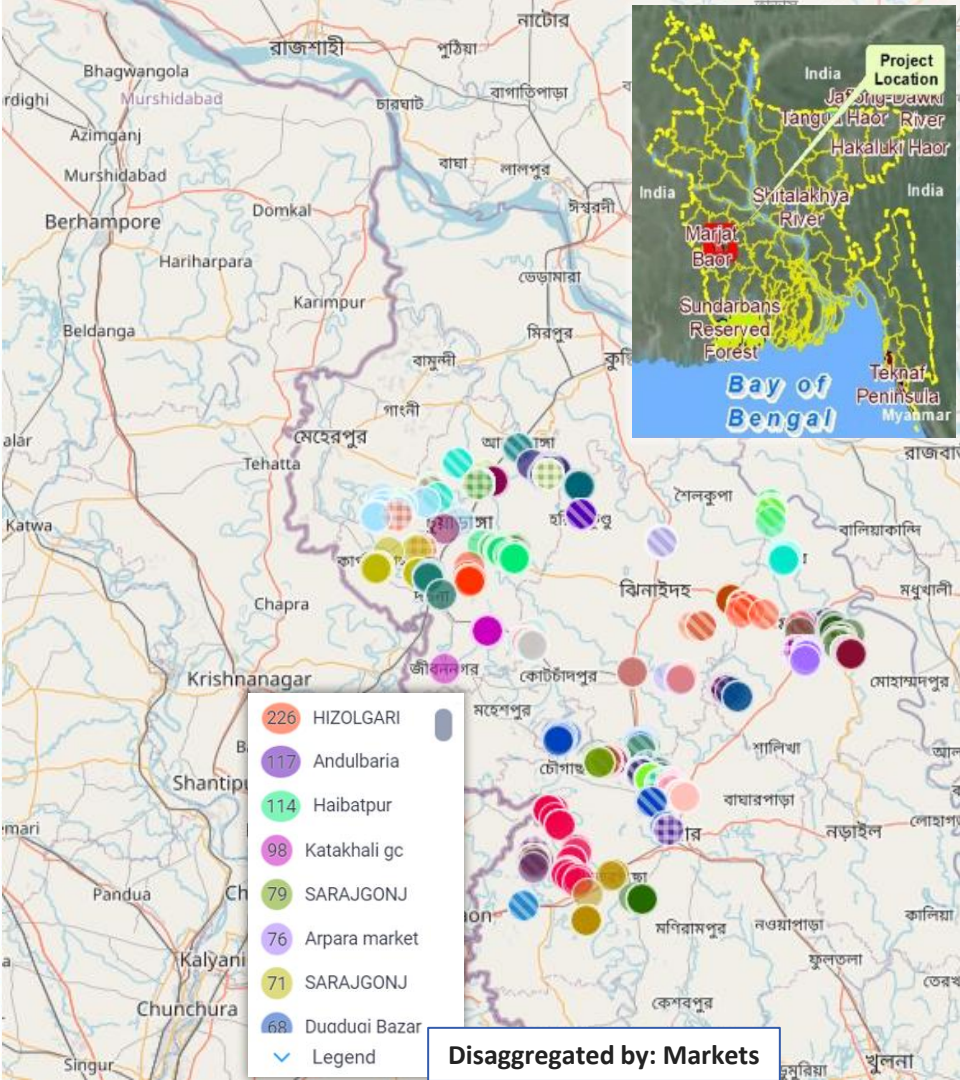

Afghanistan, Kenya, Haiti, etc.

## Tailored Client Use beyond WBG Ops

Various Adoptions around the World

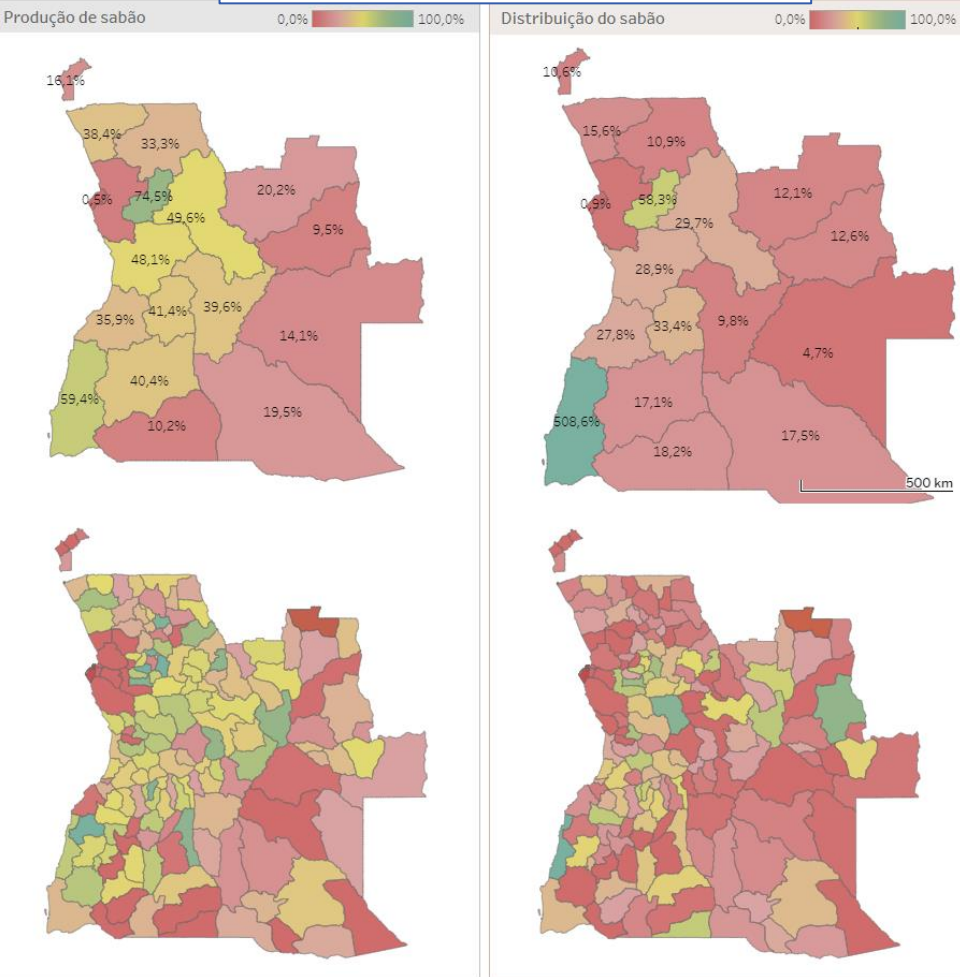

The Western Economic Corridor and Regional Enhancement Program (WeCARE) plans to transform a 260km national highway in Western Bangladesh into an 'economic corridor' to improve rural connectivity.

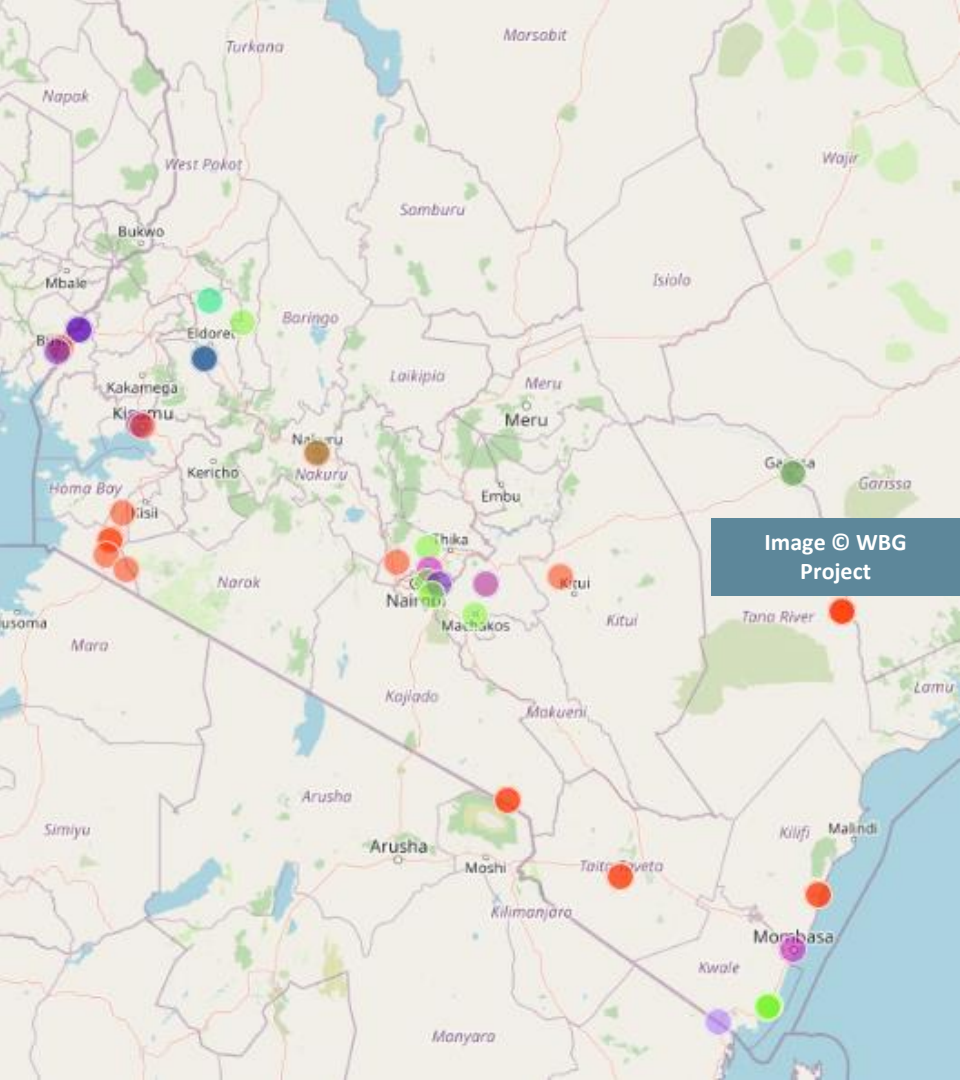

- WeCARE uses GEMS to digitize their M&E needs, collecting remote supervision data on:
  - Physical infrastructure
  - Market dynamics
  - Rural road conditions
  - Monitoring beneficiaries
  - Safeguards
- As a result, about 25,000 market sites were surveyed.

## Soap distribution monitoring to schools: in all provinces, municipalities, and communes

The Angola's Learning for All (PAT) project aims to improve teachers' skills and knowledge; school management and systematic student assessment.

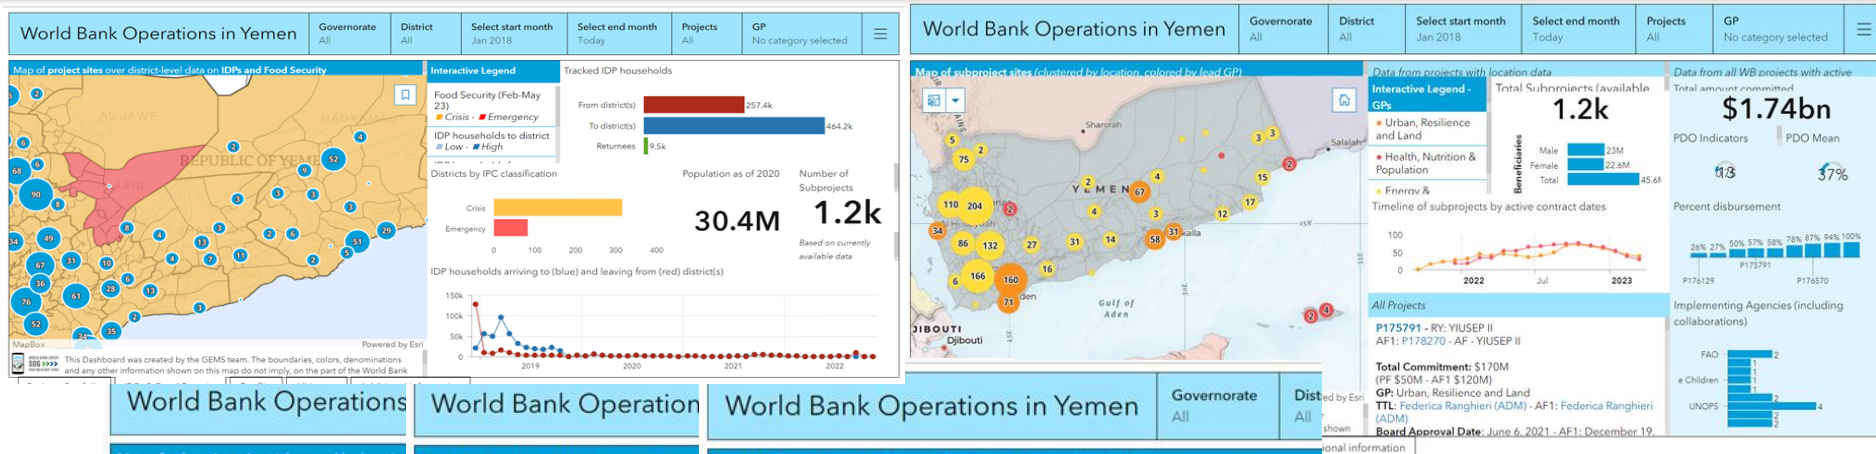

- With GEMS, the PAT team were able to monitor 19 activities in real-time and collect over 25,000 granular project data over the course of a year.
- Monitoring efforts include teacher trainings across 164 municipalities, soap and cleaning kit distribution to schools in all communes
- Implementation of TEACH, a holistic measuring tool to improve the quality of primary education.
- Due to real-time monitoring, project reduced reporting and communication complexity, and enhanced decision-making.

The Kenya Ministry of Health and the COVID-19 Health Emergency Response use GEMS to monitor the quality of health services, patient feedback and Social Safeguards in various regions of the country.

- With Prior using GEMS, the ministry relied on paper-based data collection, which led to inefficiencies, slow processing times and limited accountability.
- Systematically collected data via GEMS includes, e.g.:
  - Observations on the provided care from the clients' perspective and suggestions for improvement, for both, facility care and home-based patients
  - Reports on medical waste treatment at 130 facilities
  - Social safeguard issues, including related to GBV, social inclusion and various grievances
- As a next step, the project aims to develop advanced data dashboards based on GEMS, which promises to improve real-time insights

# Geo Enabled Monitoring Systems (GEMS) FOR Environmental and Social Framework and Environmental and Social Safeguards Monitoring....and beyond

---

## The Island Experience- Maldives and Sri Lanka

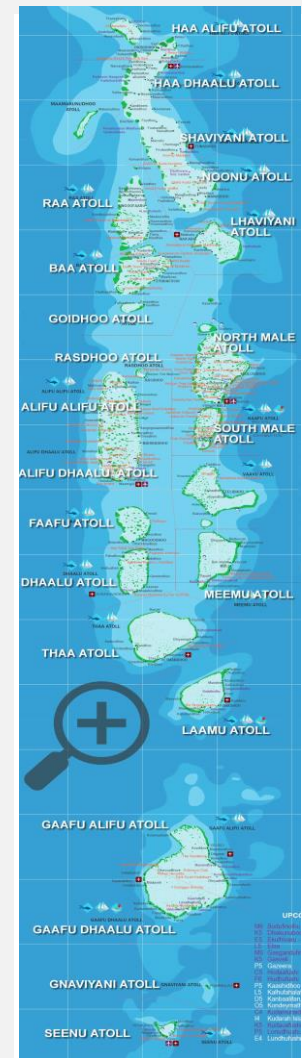

Mokshana Wijeyeratne- Senior Environmental Specialist, The World Bank

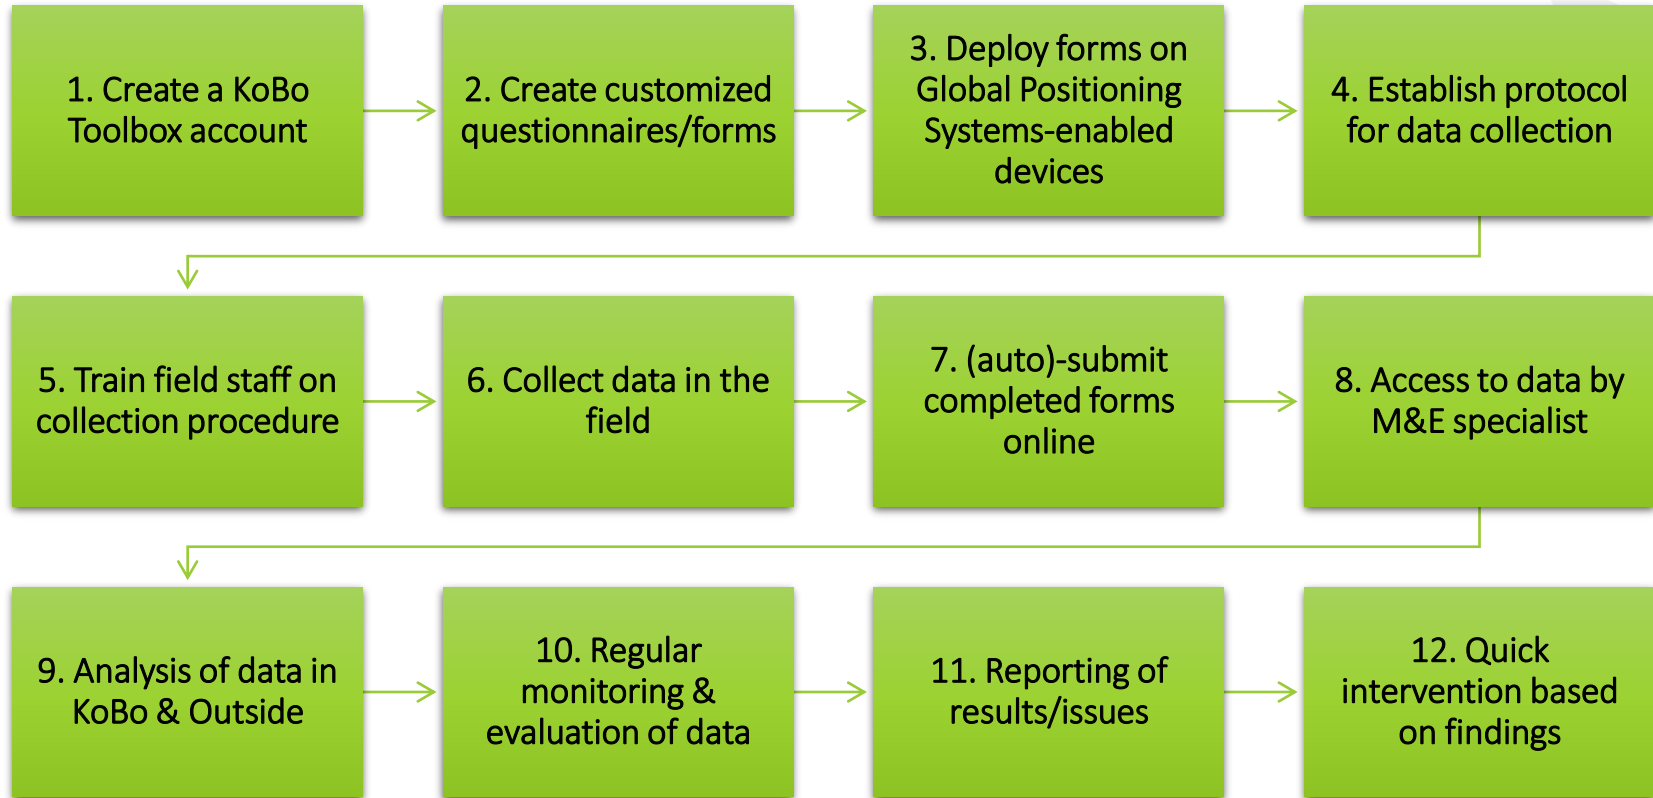

# The GEMS Experience: Why Remote Monitoring

- **In the Maldives- Geographic Spread and Resource Deficiency**
  - The Maldives consists of 1,192 coral islands grouped in a double chain of 26 atolls.
  - 188 inhabited islands, Stretches along a length of 871 kilometers (541 miles) North to South.
  - Spread across a vast sea area of 90,000km<sup>2</sup> in the Indian Ocean.
  - For Maldives Travel is possible only via air and sea
  - Shortest boat ride from Male the capital to islands in the project area is 2 hours on a day with good sea fairing conditions or a 30-minute domestic flight and then a 30-minute boat ride.
  - Dynamic weather often can inhibit travel and travel costs are high in the Maldives- US\$ 300-500 for a domestic flight.
- **In Sri Lanka- project sites are often 30 minutes to even 5-8 hours or more from the center.**
  - Field offices often not well equipped to travel- vehicles or human capacity
  - some projects have 100s of project sites in over 9 Provinces.
  - Terrain changes from hilly difficult to access areas to flat terrain.
- **Typically, it takes time for those monitoring to write up paper-based reports and share it with the Project Management Unit (PMU) - 1-2 weeks and then the PMU takes at least a week to prepare summaries to report to the Bank**
- **PMU teams can not visit every site as often as they want and need verifiable data on how things are going- are people going to the sites to monitor or not?**

# The Typical Steps to Getting Things Going

# Our Data Collection Strategy

PMU Environmental Specialist (ES) Builds the Form and has the Bank Team Review and Authorize the Standard Form- It can be customized for site specific ESMPs via already preset questions in a library

ES Deploys Form to Island Councils (ICs)/Data Collectors

The data flows real time to the kobo server and is accessible to the ES, other PMU Staff and can be shared with any one and used to generate reports.

Island Council supervisors/Environmental Officers visit the site and fill the form based on their field observations on implementation

Data can be downloaded, used to communicate guidance back to ICs and Contractors and raise issues with the Bank via monitoring reports and used to analyze trends.

---

# How we over came challenges?

- The initial form building took time as we were all new to it, we made errors, but we learned.
- The form builder can have minor system kinks, but these can be easily solved with the repository of online help and the GEMS team has always been an email away.
- Had to do some initial data clean up on the first rounds.
- Could not do face to face training for Island Councils and Implementing Agencies, but it was done remotely amidst the Pandemic, and it has worked- training does not need to always be face to face.
- Guidance from the GEMS team and regular check ins helped as the tool evolves too- Translations, email alerts, photos in instructions all came in late and we learned as we worked on it.
- HAVE AN OPEN MIND!

# What Helped Us

## Leadership & Will

Champion, Support and push from the Task Team Leaders

Will from the PMU to use the training and deploy the program.

Support from the GEMS team .

The whole team was open to learn as no one was an IT expert. Until you try the software you will always be skeptical.

## Training & Trialing

The 4-day training is very useful as you learn the HOW-TO vs WHY TO?

The Bank team being trained helps support and guide the client team and understand issues better and think of innovating ways of use together.

The GEMS team constantly supports even post the training

## Learning by Doing

The more we used the tool to develop forms it helped us learn on troubleshooting.

Has helped to keep updating and improving the form from the field data collection experience

Have learned how it can be tailored for other data collection purposes- say for baseline data collection for a Environmental and Social Instruments and other studies, environmental auditing.

# Developing a Standard Monitoring Form

- We have a standard form which presents all atypical Environmental and Social risks and related monitoring questions and questions relevant to a site-specific issues as well.
- A Standard Environmental and Social Compliance Auditing Form was developed in 2022.
- Example Link: <https://ee.kobotoolbox.org/x/N61v74Bk>
- Standard questions can be copied in via the software's question database.
- Forms can be cloned and edited process to develop new forms via one click.
- Additional site-specific questions and specific can be included to the same.
- Based on the case studies and the experience in both countries we created a generic form by including all typical environmental and social questions that need to be specifically looked at during field reviews.
- The form also provided instructions to enumerators via tips and examples
- Skip logic is used prevent the need to spend time filling all questions or lead to additional questions where needed.
- Specific questions can also be made mandatory as per the teams needs via the form development tool.
- The quality of the data you get will depend on how well you customize and use your form to get the monitoring data you need.
- The form can be edited even post deployment.

---

# How Have We used the Tool

- In Sri Lanka- Slow but steady momentum

The standard form developed for Environmental and Social monitoring (ESMPs) in the Maldives was used to develop a standard form for Sri Lanka-and now widely replicated.

Used for Implementation Completion Reporting for the Climate Resilience Improvement Project (CRIP) in 2020 amidst Covid and to monitor closure of ESMPs for final set of physical works projects

The Water Supply and Sanitation Improvement Project (WASSIP) in Sri Lanka has commenced use of the tool for E and S Compliance Monitoring.

Local Government Development project-1000s of sites with accountability issues- A Audit was conducted to find non-compliance issues in a problem project- a Environmental and Social Compliance Audit form was developed via this process.

Emergency Response- in Sri Lanka in 2022- Tracking Environmental and Social Compliance and Grievance Redressal Recording in Fertilizer Distribution

We also use the tool for Monitoring of Environmental and Social Codes of Practice from 2022- as we have many projects with sporadically spread sites.

---

# How Have We used the Tool

- In the Maldives- A few examples of many

Covid Project, the Ministry of Health used Kobo toolbox to collect data on Health care waste management at all Atoll Facilities as a baseline survey to support work on Health Care Waste Management Planning and understand needs.

The Renewable Energy Projects (3 Projects) has developed a form of monitoring solar PV installation projects. They have also used it for Grievance Redressal and Stakeholder Feedback Collection and ESF Monitoring- Linked with QR Codes.

Kobo being used for collecting implementation and compliance monitoring via supervision consultants, contractors, implementing agencies, for the current ongoing Island Waste Management Center Rehabilitation civil works in our Solid Waste Management Project.

For the Vandhoo Regional Waste Management Facility for operational monitoring of the facility a specific form was developed and finalized in September 2020, which can be transferred to the Environmental Protection Agency for post project closure.

Regional Waste Data Collection by the Ministry of Environment's Waste Management Department to set up a country wide solid waste management related database.

In the Maldives Country Environmental Analysis- A Tourism Resort Survey on Environment and Climate Change

# Survey Environment and Climate

## Related Context and Challenges in Resort Islands in the Maldives

Un autre Sahel est possible

[www.cilss.int](http://www.cilss.int)

# Food security early warning and disaster risk reduction by AGRHYMET, with the support of SERVIR -WA

Dr. Abdou Ali, senior hydro climatologist, head of the information and research department  
AGRHYMET Regional Center, Niamey, Niger, Tel-WhatsApp: +227965612

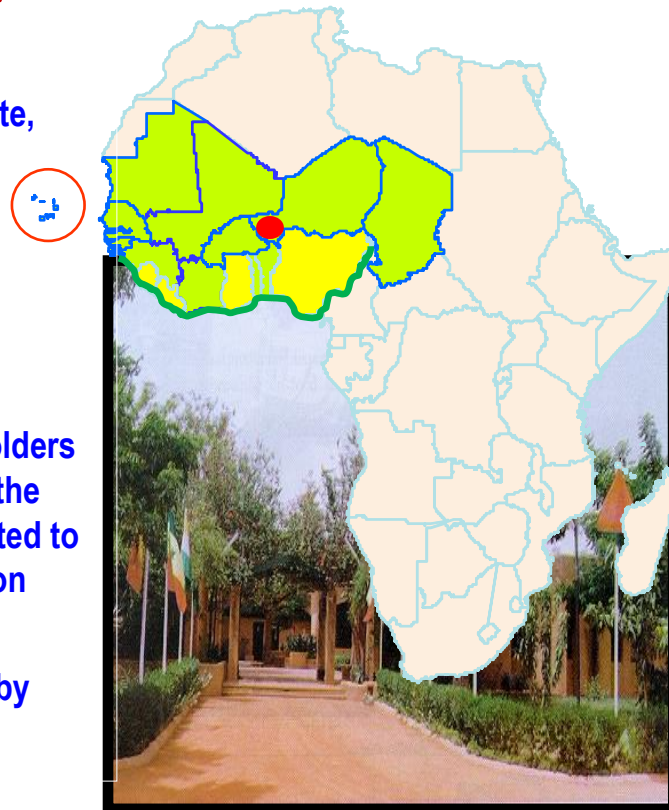

# AGRHYMET = AGRrometeorology, HYdrology, METeorology

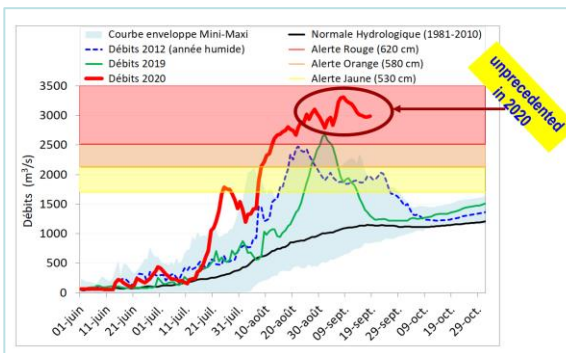

AGRHYMET is the regional climate centre for West-Africa and Sahel

## Missions: Information, Training, Research services

- Collecting, processing data and disseminating information on climate, water, agriculture, food security, natural resources management at regional scale for decision makers and users
- Strengthen technical and scientific capacities of countries and stakeholders through degree and short training, the transfer of tools and methods adapted to the West-African and Sahelian region
- Strengthen inter-state cooperation by sharing knowledge and technology among member states

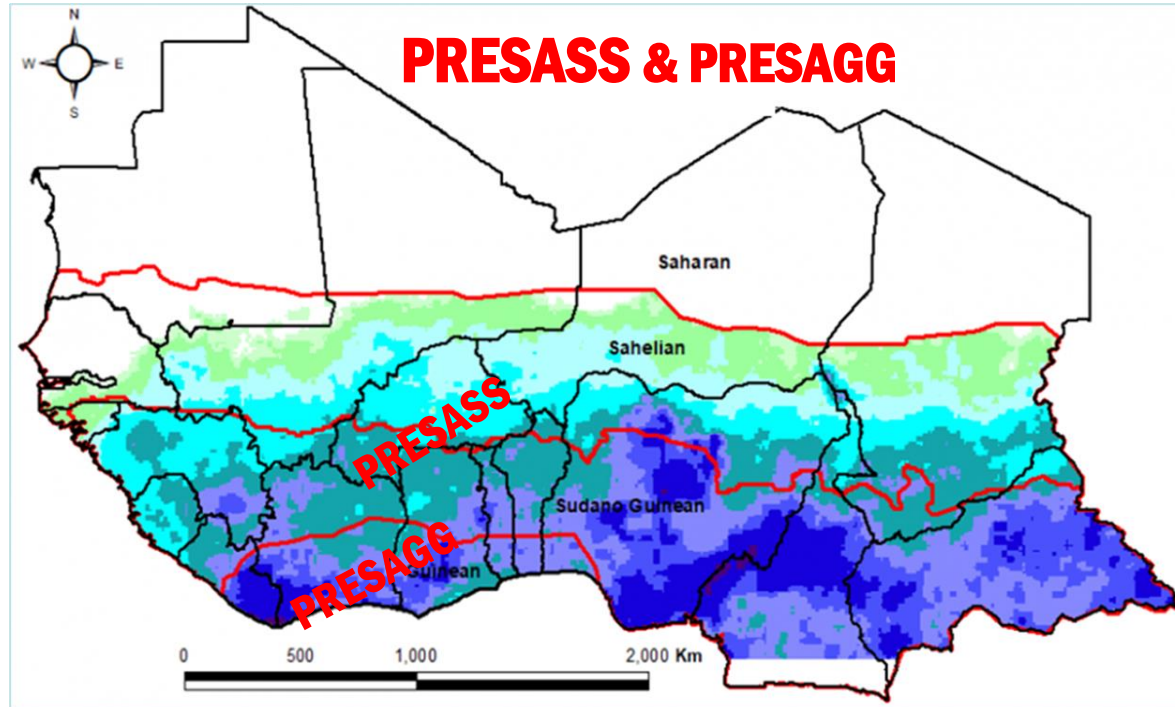

# Continuous intensification of hydro-climatic extremes in West-Africa

**What adaptation and risk management strategy should be adopted in the face of the new climate situation?**

**Seasonal and sub-seasonal forecast are one of the best climate services for strategic planning of rainy season activities in West-Africa where more than 80% crops are rainfed**

**SERVIR is collaborating with AGRHYMET to improve S2S in West-Africa**

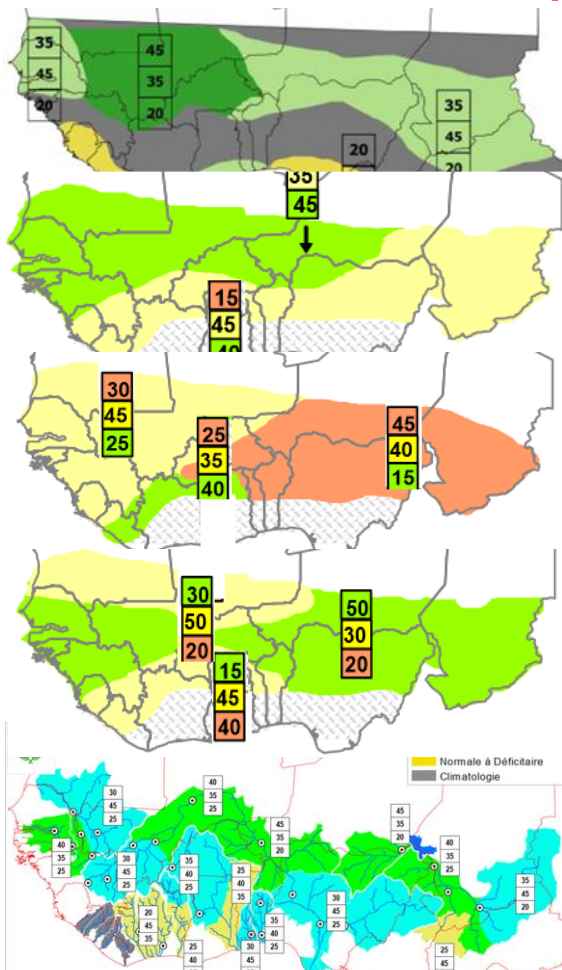

Un autre Sahel est possible

[www.cilss.int](http://www.cilss.int)

## Satellite data, climate model inputs, in particular the NMME models, are used by the West-African institutions to develop regional tailored seasonal forecast products

- Choice of land for crop production (high, low, etc.)
- Choice of crop types varieties (adapted to short, long rainy, less rainy, etc.)
- Preparedness for risks, especially flooding, such as avoiding settling in flood-prone areas
- Preparing investments to take opportunities of the upcoming rainy season
- Whether or not lean seasons are extended (especially for pastoralism issues, etc.)
- The choice of whether or not to take out agricultural insurance
- Setting objective curves for dam management

On the beginning of each rainy season, all actors (farmers, disaster managers, etc.) impatiently await the seasonal forecast information that guide them for their activities for the upcoming season

## Recent survey from a World Bank funded project: FSRP

Un autre Sahel est possible !  
[www.cilss.int](http://www.cilss.int)

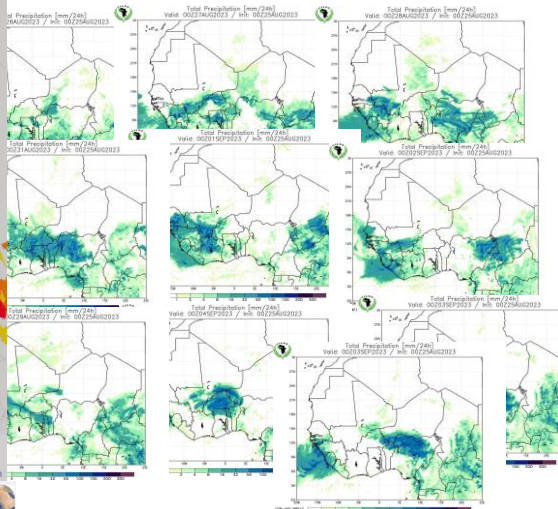

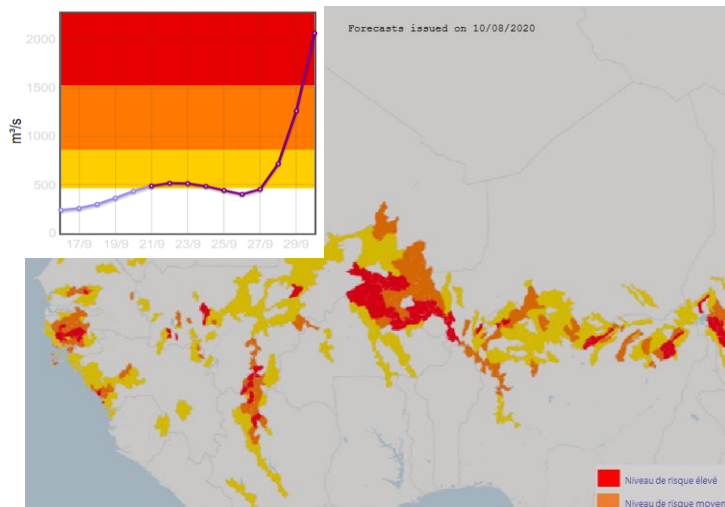

**More than 74% of all users of AGRHYMET services use seasonal forecast services**

Surveillance Climatique

Climatic monitoring consists of daily data collection and regular production of products (diagnostic bulletins and climate status, references and climate indices, etc.), monthly maps for various climate parameters, such as rainfall, temperatures (average, maximum and minimum), over West Africa and the Sahel.

Climatological diagnostics

- Monthly climate diagnostics bulletin: including average, maximum and minimum temperatures, total rainfall, other essential elements
- Periodic climate status (watch): climate bulletins and information for ACC users, as needed, based on the forecast of significant regional climate anomalies

Climatological references

monthly data of climatological averages including mean, maximum and minimum temperatures, total precipitation, other elements by station for various reference periods: 1981-2010; 1971-2000; 1961-1990; 1951-1980

Climatological indices

- Climatological indices of extremes (Rclindex), depending on the study
- Drought index (SPI): 1 month, 3 months, 6 months, 12 months
- ENSO
- NAO

### West Africa SubX Data

#### Experimental high-resolution subseasonal-scale forecasts

Please note that new maps are typically available by 9 am GMT each Friday; however, if the latest forecasts from all models are not available, the maps will also be updated on Saturday and Sunday at 9 am GMT.

The maps below show high-resolution (5km X 5km) climate forecasts over the next 30 days for the Permanent Inter-State Committee for Drought Prevention in the Sahel/Comité permanent inter-Etats de Lutte contre la Sécheresse dans le Sahel (CILSS)-monitored countries in West Africa. These maps are generated by performing a quantile mapping-based bias-correction and downscaling of the forecasts from the North American Multimodel Ensemble (NAMS) project (Pegion et al., 2019), which provides climate forecasts based on multiple climate models. We are currently using climate forecasts from 10 models. The bias-correction and downscaling process involves two key steps: (1) downscaling of the SubX forecasts from a spatial resolution of about 100 X 100km to 5km X 5km and (2) bias-correction of downscaled forecasts at a daily scale using downscaled hindcast and observation climatologies of 7-day windows centered on the target day sampled from 1999-2016.

The maps show a multimodel forecast of (1) Consecutive dry days (longest spell of days with precipitation below 1mm) and anomaly, (2) total rainfall over the next 30 days, and (3) number of rainy days in weeks 1 to 4 that receive rainfall more than 0, 5, 10, 25, and 50mm. Multimodel forecast, in this case, is simply the median of the ensemble forecast of the above variables. In the near future, we plan to provide similar maps using temperature forecasts.

These are experimental forecasts generated by the support of NASA-SERVIR Applied Sciences Team grant 80NSSC20K0163.

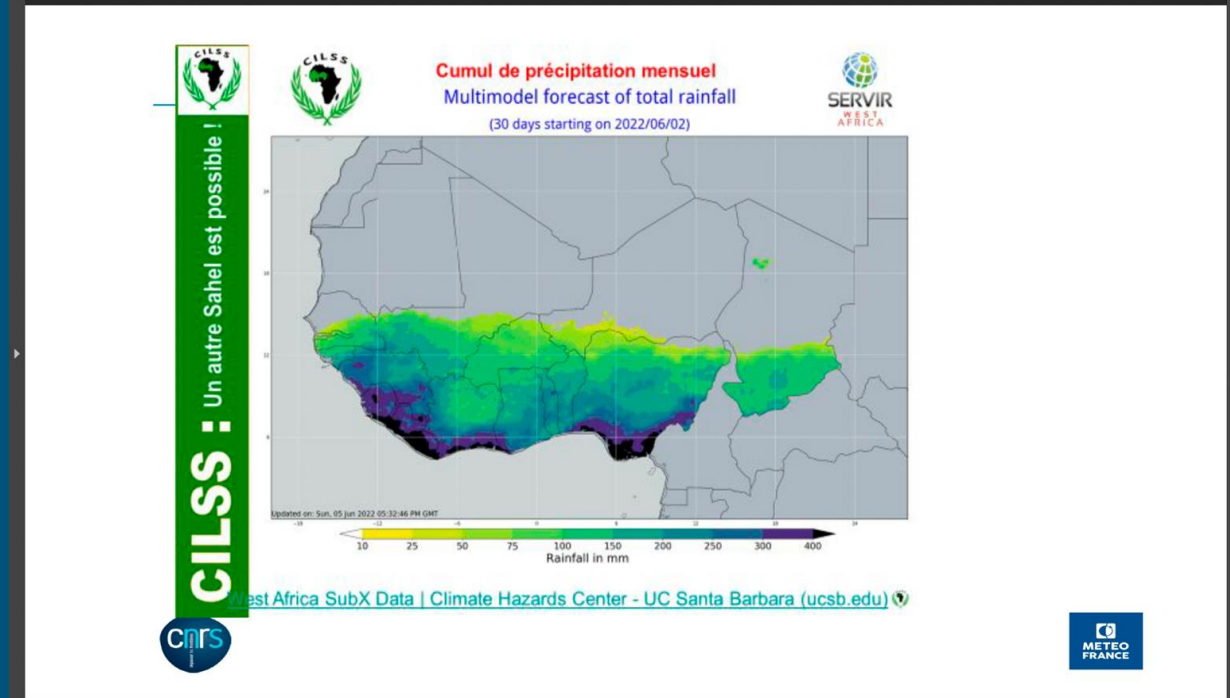

Current Month Skill

Consecutive Dry Days	1-month Lead	Total Rainfall
30-day Plot	1-week Lead	Rainfall in Millimeters
30-day Plot + Anomaly	2-week Lead	
	3-week Lead	

Number of Rainy Days:				
Week 1 - 00 mm	Week 1 - 05 mm	Week 1 - 10 mm	Week 1 - 25 mm	Week 1 - 50 mm
Week 2 - 00 mm	Week 2 - 05 mm	Week 2 - 10 mm	Week 2 - 25 mm	Week 2 - 50 mm
Week 3 - 00 mm	Week 3 - 05 mm	Week 3 - 10 mm	Week 3 - 25 mm	Week 3 - 50 mm
Week 4 - 00 mm	Week 4 - 05 mm	Week 4 - 10 mm	Week 4 - 25 mm	Week 4 - 50 mm

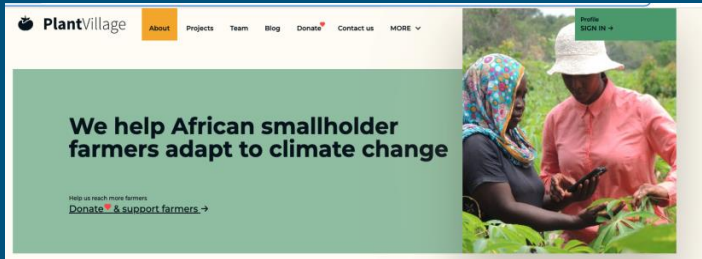

# Use-case of high-res subseasonal climate forecasts through AGRHYMET

- AGRHYMET shares these forecasts with the Monitoring and forecast of IntraSeasonal Variability over Africa (MISVA) project.
- This is a joint research / operational collaborative action between Meteo-France and the West African weather forecasting services such as: ANACIM (Senegal), Mali Meteo, ANAM Burkina Faso , DMN Niger, ANAM Chad and DMN Togo.

# Use-case of high-res subseasonal climate forecasts through PlantVillage

## USAID's The Feed the Future Innovation Lab

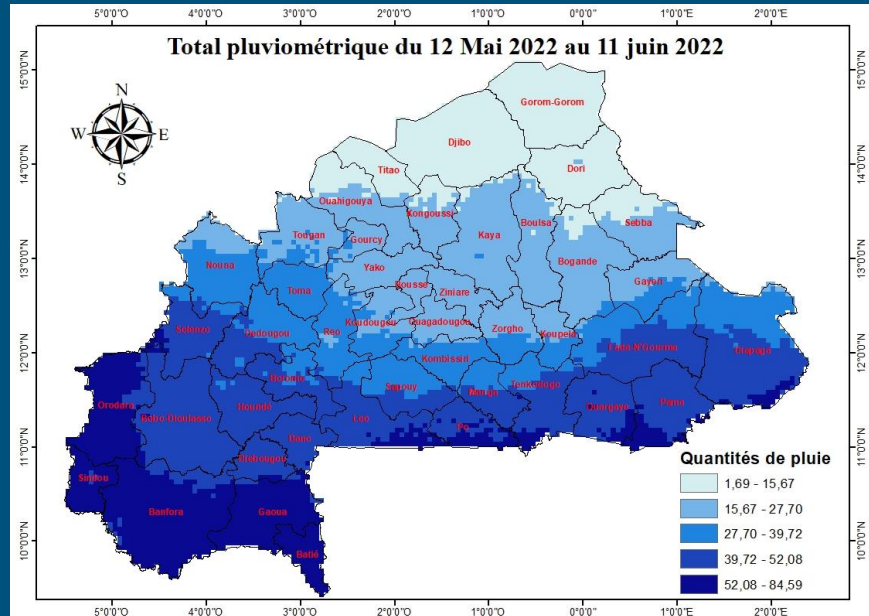

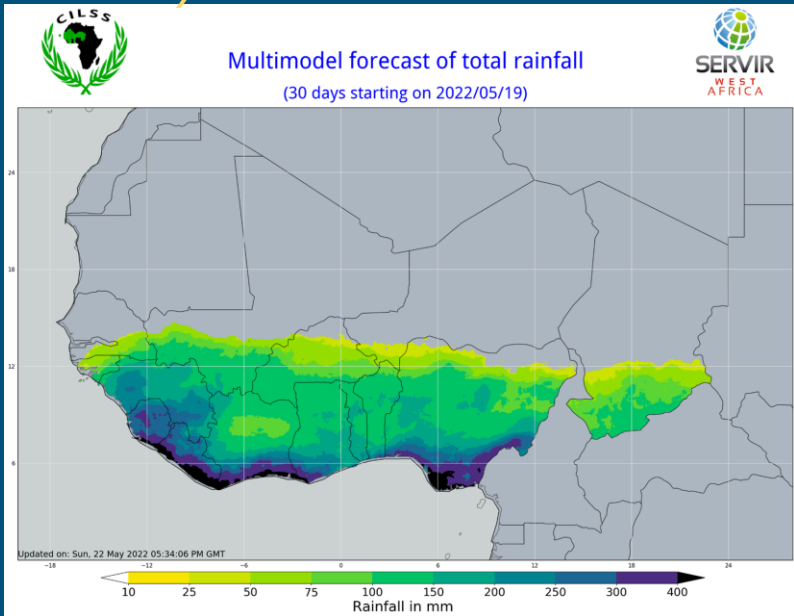

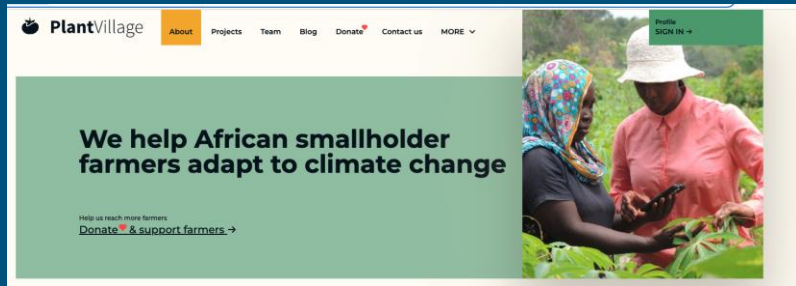

Objective: To increase the yield and profitability for millions of farmers with the ultimate goal to reach hundreds of millions in partnership with an ecosystem of farmer facing organizations and the farmers themselves.

PlantVillage employs a triple A model Algorithmic, Agricultural, Advice that includes “weather forecast messaging”, as a part of which high resolution subseasonal forecasts are being disseminated to farmers in (a) Burkina Faso and (b) Kenya (mainly ASAL counties)

# Use-case of high-res subseasonal climate forecasts through PlantVillage

Reaching up to 12 million people in Burkina Faso, 8 to 9 million farmers in Kenya (ASAL counties)

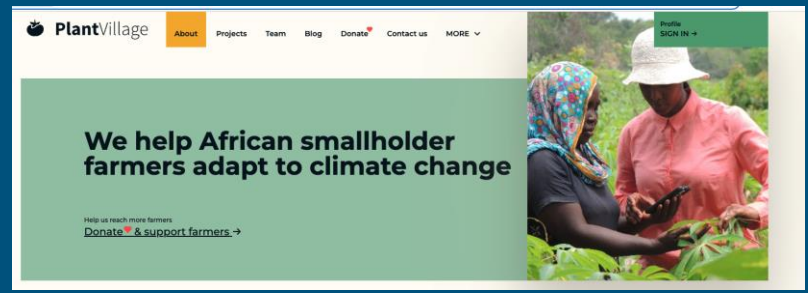

# Use-case of high-res subseasonal climate forecasts through PlantVillage

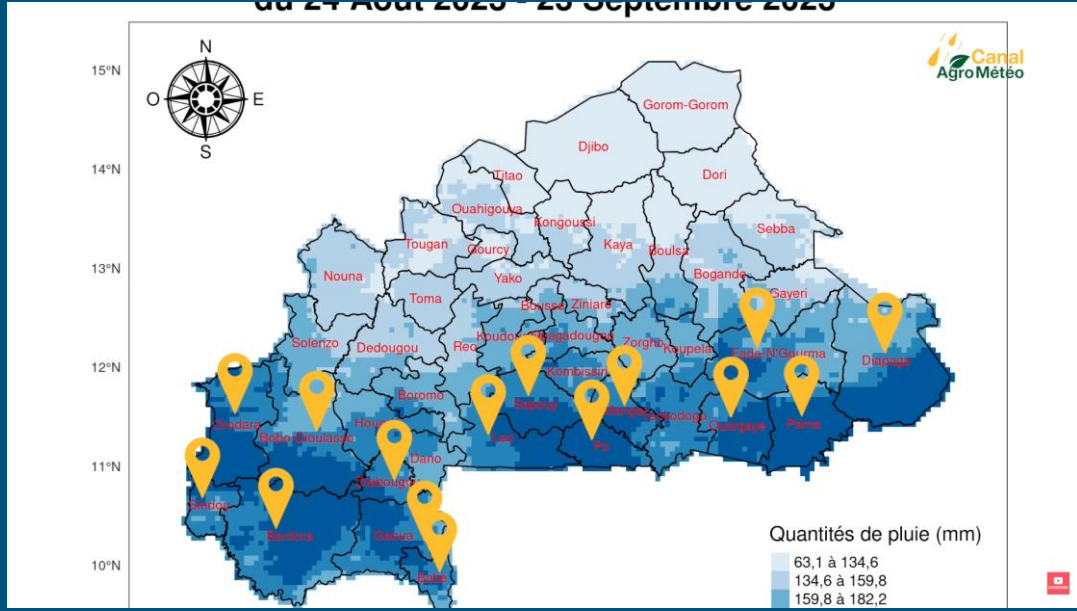

Reaching up to 12 million people in Burkina Faso, 8 to 9 million farmers in Kenya (ASAL counties)

Medium of dissemination includes

# Use-case of high-res subseasonal climate forecasts through PlantVillage

Type of supported decisions include:

- Migration decisions based on pastoral water availability.
- Vaccinations or other preventive measures for livestock pests and diseases.
- Implementation of adaptive measures, like diversifying livelihoods or investing in water-harvesting technologies.
- Management of resources more equitably and preventing potential conflicts.

# Use-case of high-res subseasonal climate forecasts through PlantVillage

**Reaching up to 12 million people in Burkina Faso, 8 to 9 million farmers in Kenya (ASAL counties)**

"30-day weather forecast will play a major role in our *Cassava SOS project here in Baringo*. We will be able to know the *right time to plant Cassava* to ensure that they'll have the best chance of thriving, and also, we will be able to advise farmers on the crops they'll need to plant, at what time and *if it will need irrigation* if the rains will be below normal."

"We are using them to help the community in decision making and planning for example the *pastoralist community* can be able to *approximate the amount of feeds* they need when they know when the rains will be coming, also to prepare on how to *harvest rain water* and also work on *preventing calamities* that can be caused by heavy rains on their animals"

# Summary

---

1. Subseasonal forecasts can help address key climate services needs.
2. Through collaboration of AGRHYMET, UCSB and SERVIR AST program we are providing several high resolution climate and climate impact forecasting products using subseasonal forecasts (level-3/-4 products).
3. Partnership with AGRHYMET allows for dissemination of high resolution climate forecasts to NHMSs and other national scale end users (e.g. NGOs) in ECOWAS countries and regional projects, through dekadal briefings .
4. Partnership with PlantVillage allows for dissemination of high resolution climate forecasts to millions of users in Burkina Faso and Kenya supporting critical agropastoral decisions.
5. Continued improvement in subseasonal forecasting products and skill is needed.

# Acknowledgements

- Partners: AGRHYMET/CILSS, SERVIR-WA Hub, SERVIR Program office, PlantVillage
- Support from USAID, NASA, SERVIR Applied Science Team Phase-3 and USAID
- Thanks to the NMME SubX team (Dr. Kathy Pegion and the team) and IRI data library

# Lessons Learned using a GIS-based Decision Support Tool to inform Feed the Future planning

**Kyle Alden - Geospatial Specialist at USAID/Bureau For Resilience Environment  
and Food Security – FTF Analysis Data and Learning Division**

# Feed the Future Zone of Influence (ZOI) Concept

## Two key facets that stem from the Global Food Security Strategy:

1. The ZOI is where the Feed the Future country portfolio aims to have the largest impact on poverty, hunger, and malnutrition.
2. The ZOI is where the operating unit will measure progress at the population level. FTF target countries will perform population-based surveys within the ZOI to measure progress towards reducing poverty, malnutrition, and hunger.

# Goals and Functions of the ZOI Creation Support Tool

**Goal 1:** Streamline the ZOI selection and writing the targeting section of each FTF country plan.

**Goal 2:** Incorporate learning and evidence into ZOI selection.

**Goal 3:** Provide a framework to quickly validate whether a ZOI is aligned with the selection criteria.

**Function 1:** Identify where a ZOI could be located using on standard or USAID mission-provided quantitative data. [Process step 1]

**Function 2:** Interactively build ZOIs that incorporate both quantitative qualitative considerations. Validate whether a proposed ZOI aligns with the primary selection criteria. [Process step 2]

# ZOI Selection - Part I - Primary Criteria

Criteria	Description <i>GFSS: "Our overarching Goal is still to sustainably reduce global poverty, hunger, and malnutrition across FTF's three Objectives"</i>
<b>Opportunities for Sustainable Impact</b>	The ZOI should <b>exclude areas where there is limited opportunity for sustainable impact</b> . This could be due to a lack of viable partners, due to significant implementation constraints, or due to other donor-funded programming making Feed the Future investments redundant.
<b>Level of need</b>	Areas with the highest levels of <b>poverty, hunger and malnutrition</b> , defined here as food insecurity, extreme poverty, and stunting.
<b>Potential for agricultural- led growth</b>	Areas where there is <b>significant potential that investments in agriculture are viable and will accelerate economic growth</b> . This includes rural opportunities as well as opportunities within the broader food system.
<b>Right-size to budget and approach</b>	The geographic size and population of the <b>ZOI should be determined based on an assessment of 1) the size of likely FTF investments and 2) the cost of achieving measurable, sustainable improvements</b> in hunger, malnutrition, and poverty at the population level.

# ZOI Selection Criteria - Part 2 - Context Criteria

Criteria	Description <i>GFSS: "Our overarching Goal is still to sustainably reduce global poverty, hunger, and malnutrition across FTF's three Objectives"</i>	Illustrative Data Sources
<b>U.S. gov resource availability</b>	Consider the locations and flexibilities of existing and planned FTF programs and initiatives across all agencies. This could include consideration of overlap with existing ZOIs, RFZs, RFSAs, or other current FTF activities and other USG complementary investments that could contribute to results.	Recent and planned programming
<b>Host gov, donor, and local partner commitment</b>	Consider areas where both the national government and local governments are actively prioritizing or investing in food security and nutrition. Also consider areas where we can leverage complementary resources and expertise through partnerships and other significant donor funded programs.	Mission knowledge
<b>Non-Contiguous Areas</b>	The ZOI may be a single geographically contiguous area or may include a limited number of non-contiguous areas. Posts should carefully consider the potential inefficiencies associated with an ZOI composed of many small disconnected areas. It is preferable that programming across the ZOI reflect a unified results framework. The ZOI should not simply be defined as the location of current, disparate programming efforts.	Mission, initiative, experience with programming and results.
<b>Align with admin units</b>	Areas should be easy to communicate to partner governments and likely to align with existing sampling and survey approach	Administrative Boundaries

# Process

At each Post, **identify key stakeholders**

↳ **Attend an overview session** of ZOI guidance, process, and tool

↳ At post, **gather information:** expected budget, areas that should be excluded, higher quality primary datasets, and the locations of existing or planned investments.

↳ **Convene stakeholders for a facilitated ZOI Selection session** using the tool, this will result in at least one mission-proposed ZOI.

↳ Work with stakeholders to **refine the ZOI**, and ensure that each mission has all of the details and documentation they need to describe the ZOI.

↳ Develop and **submit a ZOI proposal** based on the guidance.

**At any point during the process, we can revisit a step or bring in additional stakeholders.**

# Part 1: Identify Potential ZOI Areas

## Level of Need

We use Poverty + Malnutrition + Hunger to calculate level of need.

Override Poverty

True

Override Maln.

True

Override Hunger

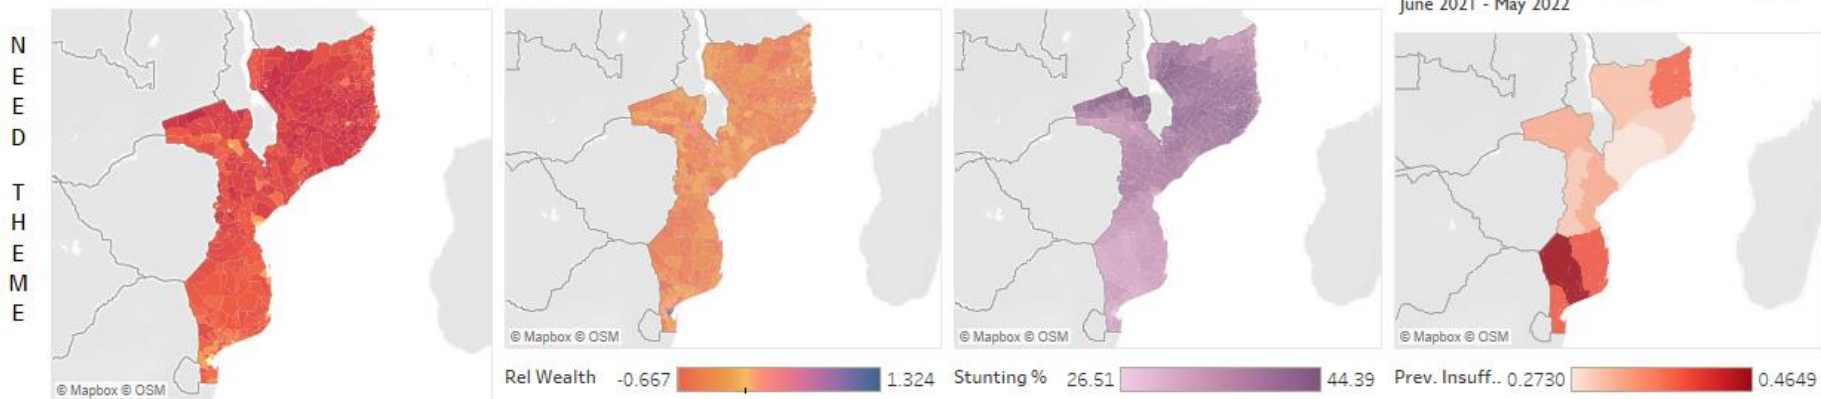

True

Need Theme (dark red is highest need)

Relative Wealth Index

Average Stunting Prevalence, Under 5 - 2019 Est

Optional: Avg. Prev. of Insufficient Food Consumption  
June 2021 - May 2022

Relative Wealth ([DIDL](#), [data at HDX](#)):

Prevalence of Stunting ([IHME](#)):

Prevalence of Insufficient  
Food Consumption (WFP):

[Mapping child growth failure across low- and middle-income countries](#) (stunting)

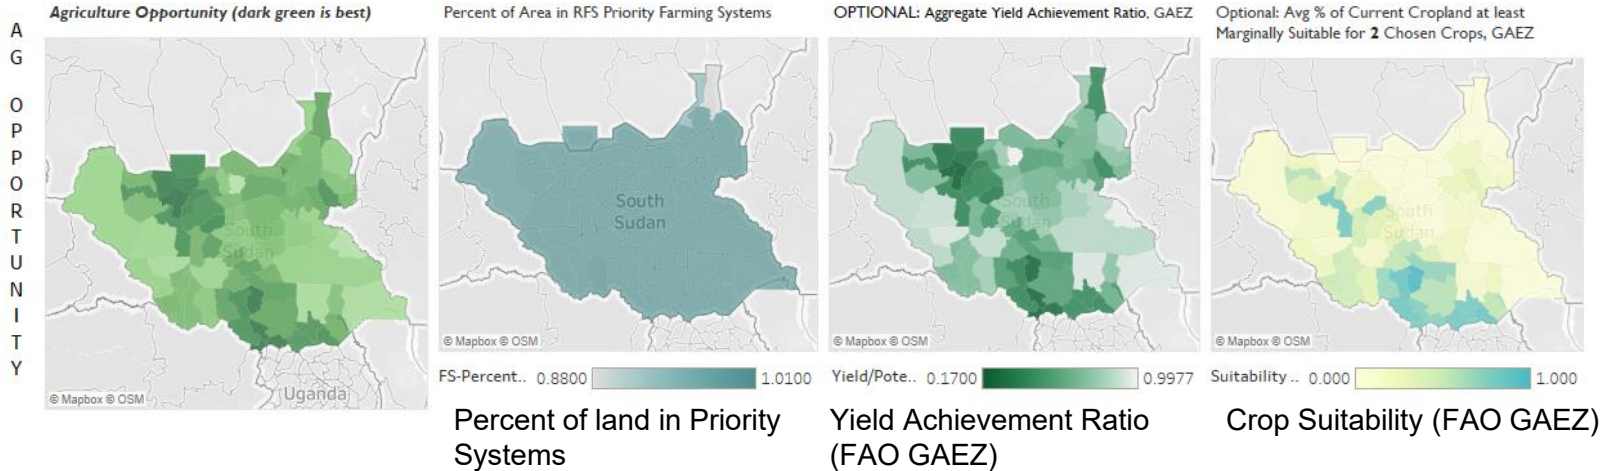

[Micro-Estimates of Wealth for all Low- and Middle-Income Countries](#) (Relative Wealth Index)

[HungerMap Live](#) (prevalence of insufficient food consumption, survey data only, year leading up to tool use)

# Part 1: Identify Potential ZOI Areas

## Opportunity for Agriculture-Led Growth

The primary factor for Ag-Led Growth Opportunity is being in an RFS-priority farming system, secondarily we can include a regions aggregate yield achievement ratio, specific crops or mission provided data.

[Partial prioritization/coordination framework for a focused research agenda](#) (RFS Priority Farming Systems)

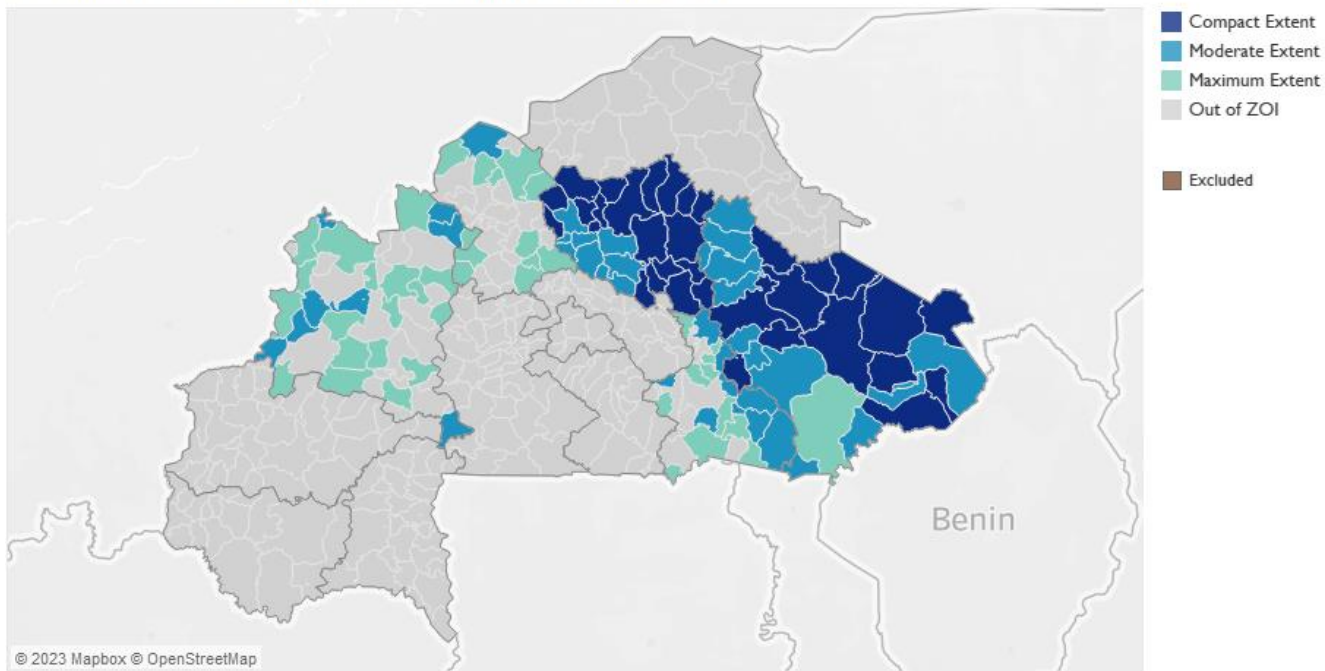

[Farming Systems and Poverty, Farming Systems and Food Security in Africa](#) (Farming Systems)

[GAEZ Aggregate Yield Achievement Ratio and Crop Suitability, Documentation](#) (Aggregate Yield Achievement Ratio)

# Part 1: Identify Potential ZOI Areas

## Output *Example*

Additional Details: recent poverty ~ 45% | poverty target ~ 41%.

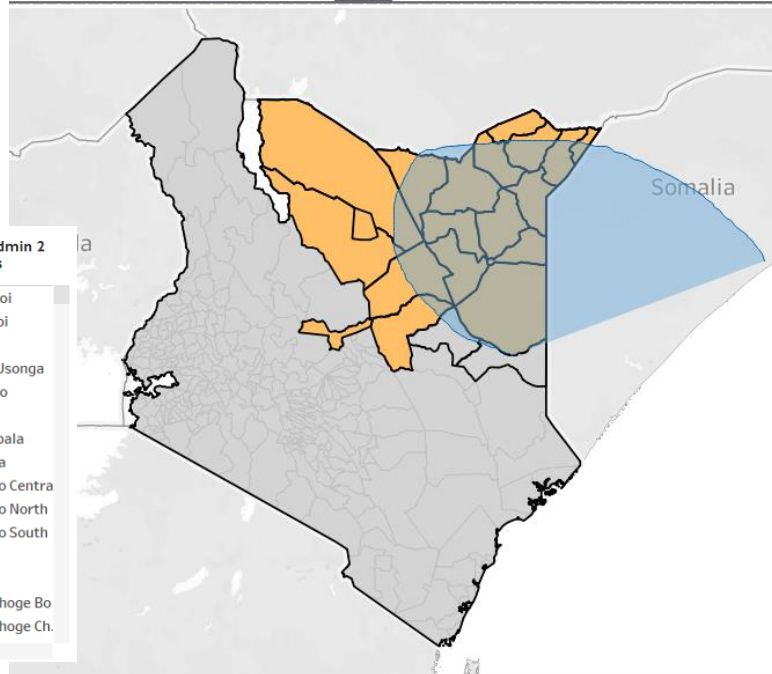

# Part 2: Proposing Zone of Influence(s)

## Selecting a Zone of Influence

Run Analysis on Selected ZOI

CLEAR ZOI CHOICES

### Step 2: Select and Evaluate ZOI Scenarios

#### Add Model Results

- Compact Extent ---
- Moderate Extent ---
- Maximum Extent ---

#### Add Resil. Focus Zone

RFZ

#### Add Current ZOI

FTF ZOI

#### Mission "Context"

DIS 'Ongoing'

Yes

#### Add Admin 1 Names

In this selected zone, the estimated population in 2020 was about 6,100,000.

We estimate that it would cost at least **38%** of your projected spending to achieve FTF's ambition in this area.

The estimated prevalence of poverty across the maximum area is approximately 19% while the estimate prevalence of poverty in this selected ZOI is 27%.

The estimated stunting rate across the maximum area is approximately 30%, in this selected ZOI it is 31%.

# Lessons Learned pt 1

1. Clear documentation of the criteria and method are essential - **having a published strategy really helps!**
2. **Customization of input datasets are key to getting user buy-in**

117TH CONGRESS  
2D SESSION

**H. R. 8446**

IN THE SENATE OF THE UNITED STATES

OCTOBER 11, 2022

Received; read twice and referred to the Committee on Foreign Relations

## **AN ACT**

To modify and extend the Global Food Security Act of 2016.

- 1 *Be it enacted by the Senate and House of Representa-*
- 2 *tives of the United States of America in Congress assembled,*

**Malnutrition: Stunting - DHS 2022 Nepal Key Indicators Report**

### Override Poverty

True ▼

### Override Maln.

True ▼

### Override Hunger

True ▼

Malnutrition 17.60 35.80

# Lessons Learned pt 2

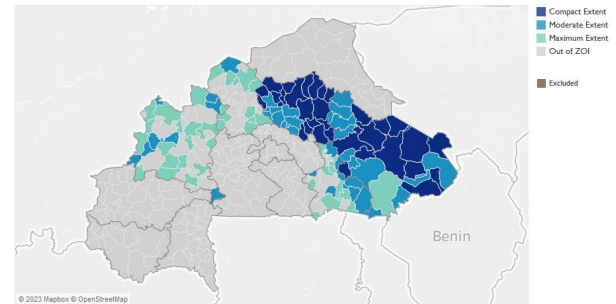

**3. Scenario building + Scenario Evaluation -**  
Decision's can't only be made with quantitative data!

**4. Users' opinions about the first output often impacted their opinion of the process and tool**

Step 2: Select and Evaluate ZOI Scenarios

Additional Details: recent poverty – 45% | poverty target – 41%
